

# Transforming hospital infection control

Temperature, Humidity and Pressure differential monitoring with neQis IPR

## Temperature and Humidity Monitoring

**Ensuring that both temperature and humidity are monitored and maintained to safe levels within areas such as the Sterile stores, this offers the department confidence that all items stored and transferred through the area are safe to use.**

NeQis IPR has proven to be very cost effective and removes the need for manual recording, which can be often forgotten within a busy department.

Having the facility of automatically logging and alarming on these conditions with the ability of viewing historic trending for compliance, with email alerts and 24-hour monitoring takes this to another level of assurance.

## Departmental Pressure Differential Monitoring

**Replacing the historic magnehelic gauge and paper-based record systems with a continuous monitoring cloud-based alerting system, eliminates risk, saves time and money, and streamlines the recording process.**

By simply adding a neQis neQdac to the existing pipework and replacing the magnehelic with an electronic differential sensor the entire system can be moved forward into today's technology.

In some sites, potentially combining both the Temperature and Humidity Room monitoring with the air differential monitoring could be a simple solution and additional savings could be achieved.

Independent Monitoring Systems

# A single package that can do all of this...

Permanent records of any faults, with time periods recorded where pressure out of specification

Traceable accuracy to UKAS standards

24/7 alarming facility

Email, SMS and on screen alerts for fault notification

Configurable alarm parameters tailored to your quality system guidelines

Trended data over any time period and historically without looking through paper records

Store unlimited amounts of data

Accessible by any device with internet access, phone, tablet, or pc and requires no AP or software to be installed

Can be used in multiple site locations

Live monitoring of your clean / IAP room critical pressure differential

Configurable user acknowledgment of alarms and errors

Temperature and humidity monitored and maintained to a safe level
